

# WATER CRISIS IN INDIA

**Currently in India more than 91 MILLION individuals do not have access to fresh clean water. It is a huge problem in the country that leads to many, many deaths.**

**Many water sources have been destroyed by pollution and raw sewage entering them. Hundreds of districts in India have reported dying groundwater levels, as stated by the Central Ground Water Board. Extreme water shortages are currently widespread in some major cities, as they were across the country during the 2009 drought.**
