

# ASBESTOS

By Talan, Nadya, & Anaiya

# WHAT IS ASBESTOS?

## Asbestos

- Asbestos is a naturally occurring fibrous mineral. There are 6 types and has fibrous crystals which are released into the atmosphere if broken.

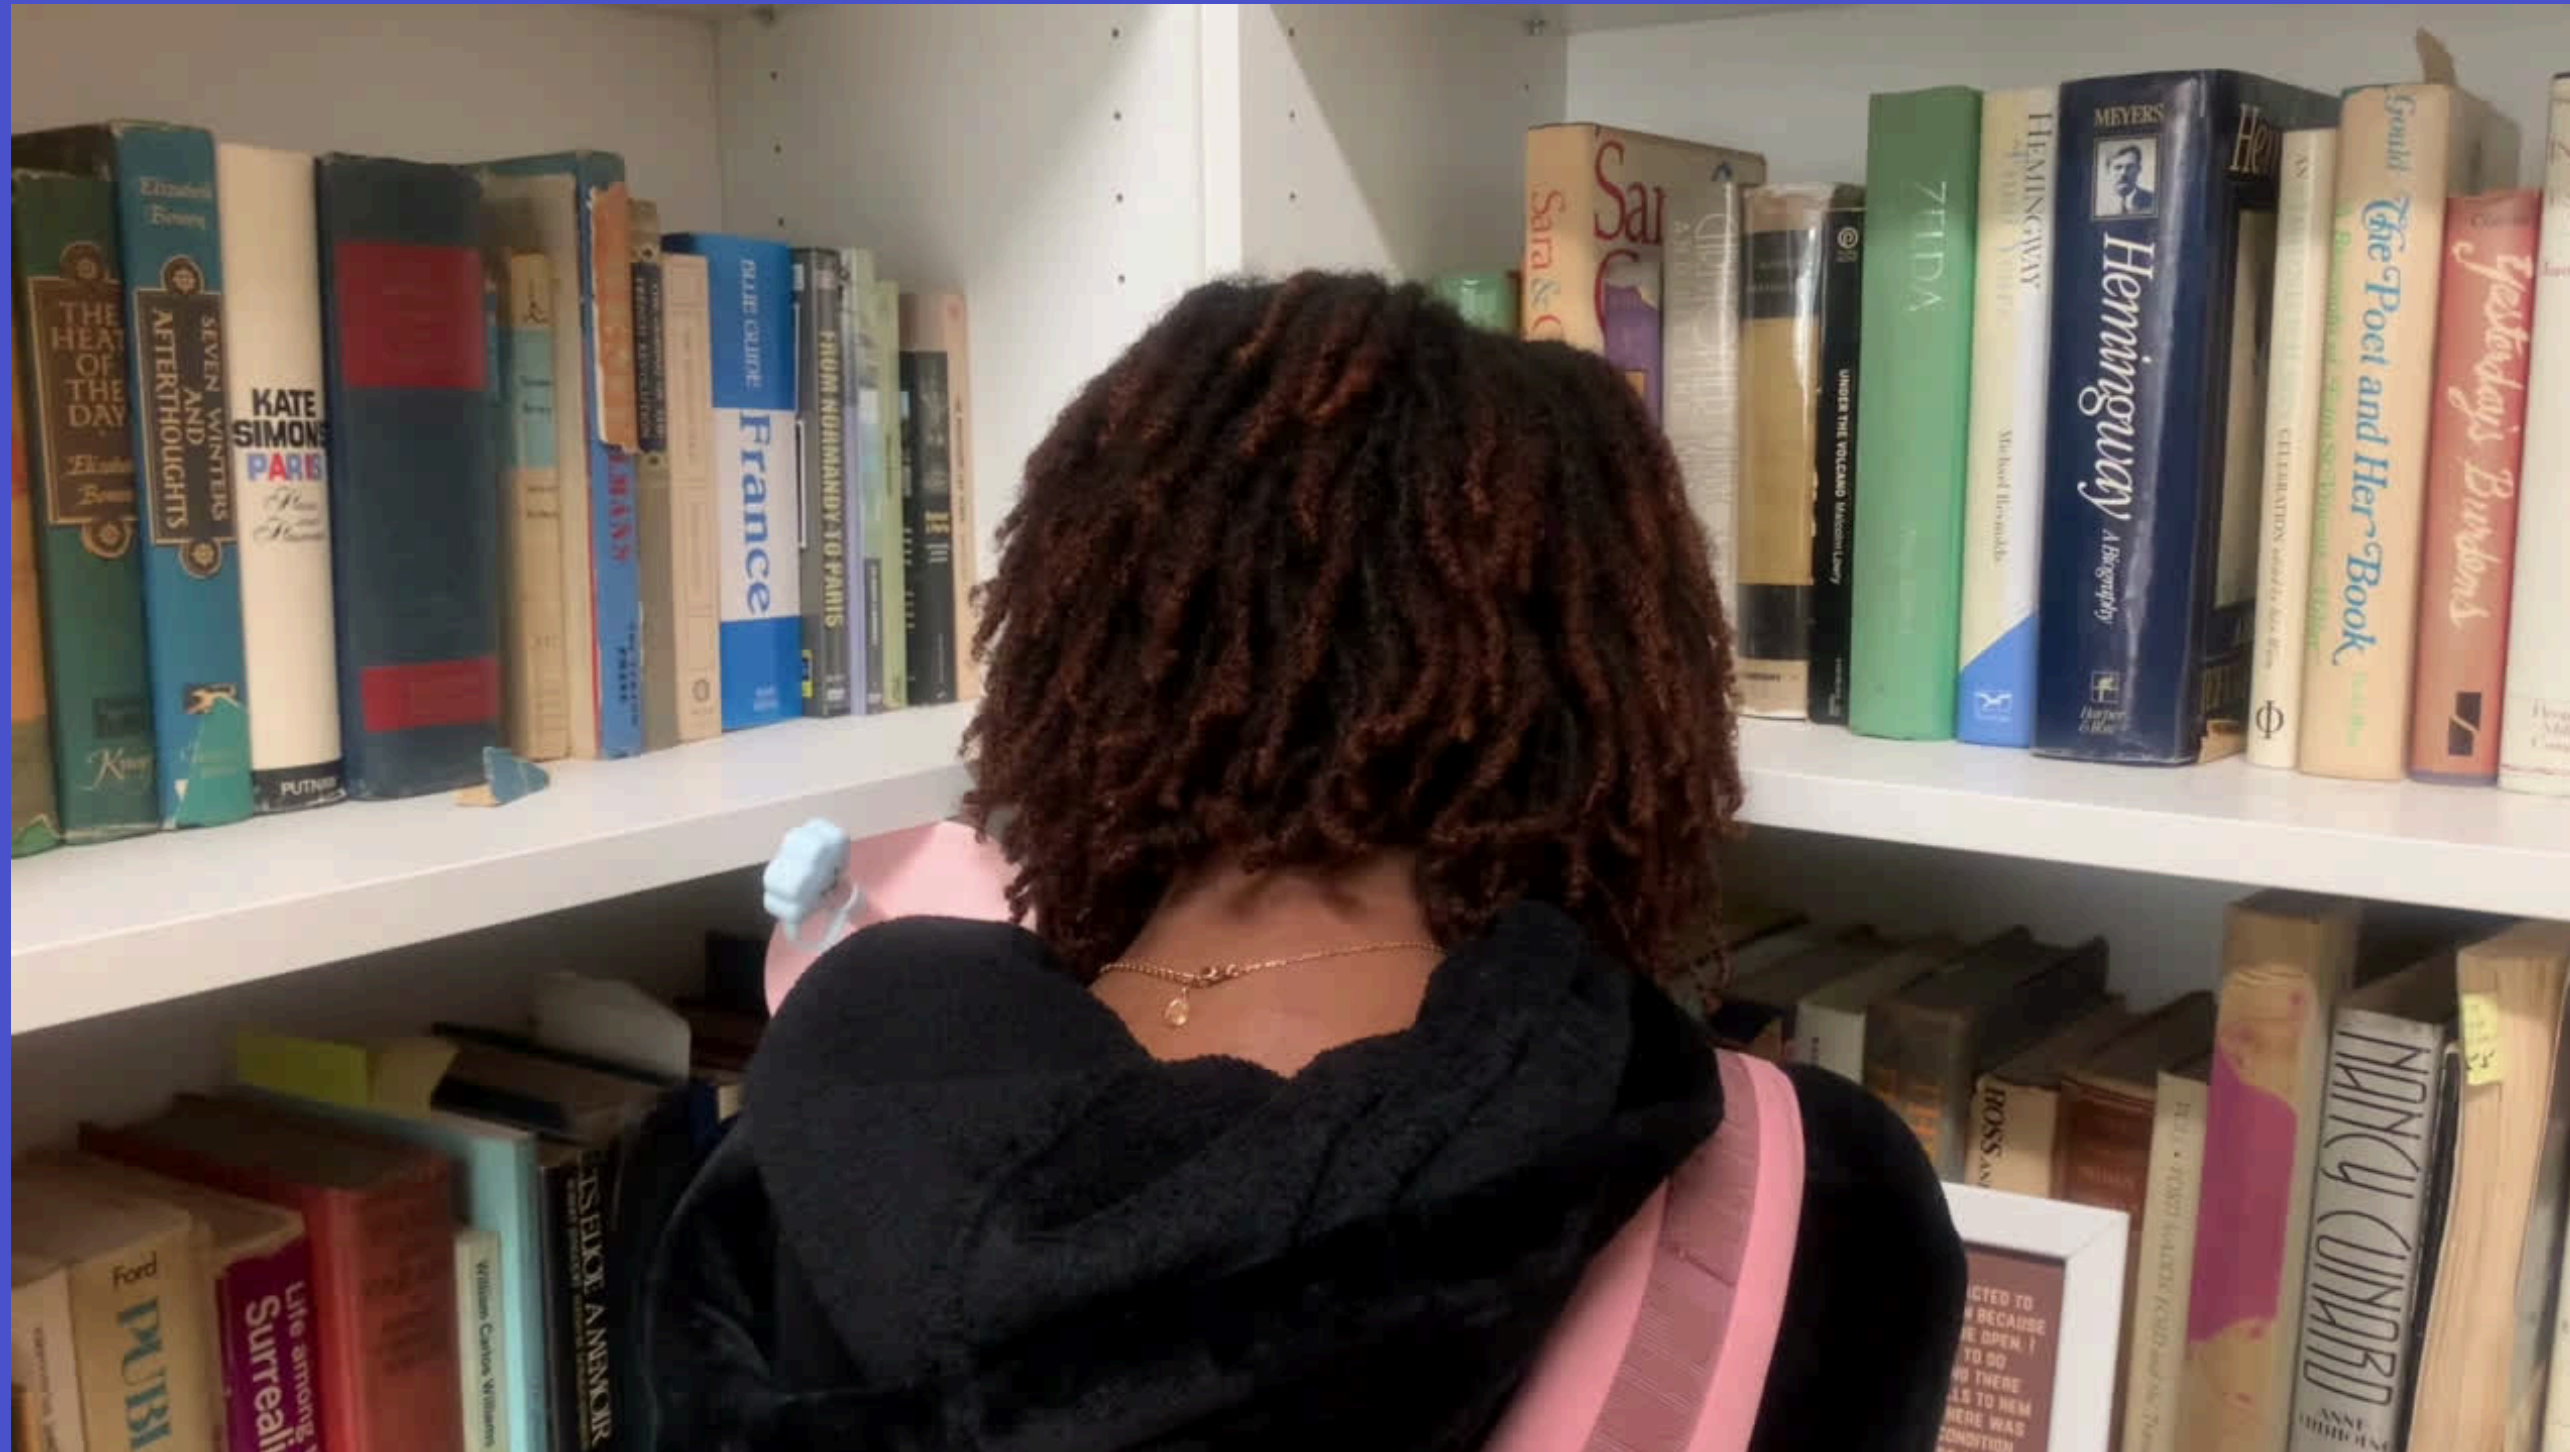

## What it's used for

- Asbestos is used mainly in building and manufacturing. It is commonly used in insulating homes and although many manufacturers are moving away from asbestos it still lies in older buildings.

## Problems/Solutions

- Because of the fibrous crystals that can break off, asbestos can be very toxic because it enters the air and leads to many health issues such as cancer. Renovating and inspecting older homes and not using asbestos are good solutions.

PSA :)

THANK YOU!
